Review of SF-1
Summary of the conclusions from the Safety Standards Committees

45th CSS Meeting
8–9 April 2019
Summary of main conclusions

1. SF-1 remains valid and is widely used and supported
   • Stability and flexibility are important considerations
2. The 2012 UNSCEAR report alone is not sufficient basis to justify a revision of SF-1
3. There are other reasons for considering a revision, e.g.
   • Closer alignment with ICRP 103 (exposure situations) and relevant associated requirements (GSR part 3 and 7)
   • Individual principles could be improved
   • New principles could be included (e.g. communication and consultation of interested parties)
   • At some time in the future, a new review/revision consideration will therefore be appropriate. A framework will be needed for involvement of cosponsors.
4. There is no justification for an immediate revision of SF-1
