**Meeting objective**

The aim of the meeting was to discuss relevant data largely from terrestrial ecosystems which will be used to provide concentration ratios for the Technical Reports Series (TRS) Handbook on Transfer of Radionuclides to Wildlife and the ICRP Committee 5 (C5) Transfer Report for Reference Animals and Plants. A further objective was to consider different options for approaches that might be recommended in the TRS to provide guidance on how to fill data gaps.

**Meeting plan**

Brenda Howard gave an introduction to the Transfer Handbook and the association with the EMRAS II WG 5 on Transfer. There followed a series of presentations (see the Meeting Agenda below) on the potentially relevant data that each participant may be able to input into the online database and generic approaches.

**Online database**

The online database constructed by the Environment Agency (EA) in the UK was demonstrated and described by Laura Newsome. The data used in ERICA have been reformatted, QC'd and input into the database for marine and terrestrial ecosystems. The freshwater database from the ERICA Tool still needs some further clarification before it is put into the online database. The current status of the database was discussed. Summary tables are occasionally incorrect and some bugs were identified. EA will attempt to address these problems as soon as possible. A list of issues to be addressed was agreed with EA during the meeting.

## **1. Consideration of CR datasets**

Some substantial datasets are being prepared for entry into the database from a number of countries for both terrestrial and aquatic ecosystems. The data arise from: (i) substantial reviews of national datasets (e.g., Canada, Russia, Finland); (ii) collations of data from specific site studies (e.g., France, Australia, Sweden, Serbia, UK, Japan, Ukraine); (iii) reviews of transfer to a particular species or organism (e.g., reptiles); and (iii) recent or ongoing studies with provisional results described at the meeting (USA, Asian countries, Ukraine). The source of contamination varies and includes uranium mines, global fallout, regulated releases and accidents. Associated actions required to ensure timely entry of the data into the database are given in the Action List below.

## **2. Generic**

A series of interesting presentations were made on possible approaches to filling data gaps using generic methods for both plants and animals. The methods described are potentially useful both for the ICRP and the TRS. Nick Beresford and Kathy Higley outlined the generic approaches currently used for gap filling and those being considered for the TRS. Kathy also described an ongoing study at Oregon State University (OSU) comparing transfer to a wide range of plant species from a small forested area. The data will be extended further and reported in November.

The phylogenetic approach to consideration of transfer of elements to plants was outlined and a paper will be produced which makes the approach and available data more directly usable for reference in the TRS. Relevant aquatic plant data are available from Australia. There may be potential to extend the approach to freshwater fish using Canadian data. The approach is complimentary to that previously outlined by Ross Jeffree of the IAEA Marine Environment Laboratory (MEL) in Monaco.

Keiko Tagami presented some data showing a correlation between stable element concentration in agricultural products and conifer needles, and asked whether this might be the basis for a potential generic approach for plants of using agricultural data for extensive species. There was agreement to pursue this further by testing the hypothesis with other relevant datasets.

The Bayesian approach described by Facilia (Sweden) was felt to be worth exploring further although it was more relevant to the ICRP report and was unlikely to be useful in providing values within the TRS, in particular by looking at how the methods described could be applied using an example.

Tamara Yankovitch has been compiling data on the internal partitioning of elements in biota to facilitate conversion of tissue specific data to whole body values. This would enable the use of CR values for edible tissues from monitoring programmes designed to assess radionuclide transfer to humans. We agreed that for the special issue she will focus on animals and a selected range of tissues (muscle, liver, bone, gonads (including eggs, foetus)).

## **3. Other issues discussed**

### ***Kd values***

The core Handbook Group had previously agreed to focus only on deriving revised CR values for the handbook and the ICRP RAPs. With regard to Kd values, it had been envisaged that previous IAEA TRS's and the ERICA Tool values would be referred to. However, further consideration of ERICA data has shown that some Kd values for freshwater are based on marine data. It was agreed that it is necessary to find out if there are more suitable data available that might be reported in the Handbook for freshwater ecosystems. The TRS (and associated TECDOC) revision considered a limited range of radionuclides, so there is likely to be additional sources. There were large differences between the revised TRS and TRS-364 values – we need to document why and discuss. Brenda will explore alternate sources and summarise the issue for the November meeting and discuss further with Sergey Fesenko.

### ***Data gaps***

Data gaps specified in the ERICA special issue papers need to be considered further and key gaps identified associated with different sources or drivers for assessment. Then potential data sources or experiments can be explored with interested Member States.

### ***LOD values***

Many datasets have less than values and the current suggested approach in the database help file is possibly not adequate (e.g., divide LOD by 2) compared with the current position in other research areas such as medical statistics (cf Kaplan & Meier) – there are methods available in stats packages and an Excel spreadsheet. The meeting discussed whether we should adopt this type of approach. If we change the recommended procedure we need to decide fast as data are being compiled by a variety of organisations. It was agreed that although this was a useful idea, there was literature available to suggest that within the likely dataset sizes and percentage of non-detects, which would be available, that the LOD/2 approach gave a mean estimate similar to the application of the Kaplan & Meier method. Therefore, the decision was made, for pragmatic reasons, not to change the guidelines at this stage. It was agreed to ask EA if a new data entry field, to identify data which has been modified, might be possible for future capability to address this issue. We could amend the help file to discuss these methods but not be definitive that they should be used, i.e., let contributors choose to use LOD/2 or the Kaplan methodology.

### ***Special issue***

Papers based on some of the presentations from the Monaco and Vienna meetings will be published in an issue of Radiation Environment Biophysics. Those people who have said they would like to submit a paper (see the table below) need to confirm that they will be in a position to submit by the end of November 2009. When doing so, they should provide an approximate title and name the first author so that Nick can supply this information to the journal editors.

\*Please confirm the first author to Nick.

\*\*Please provide approximate title to Nick.

### ***Meetings***

The next meeting of the group considering the Preparation of the Transfer Handbook will be in Ottawa in Canada during the week of 16–20 November 2009 and will be hosted by the Canadian Nuclear Safety Commission (CNSC). CEH will briefly report the outcome of both meetings of the EMRAS WG 5. The first two days will be a data discussion meeting with presentations. The last three days will be a TRS drafting session by the Core Group.

The next meeting of the EMRAS II WG5 will be held during the Second EMRAS II Technical Meeting (TM), being held at IAEA Headquarters in Vienna, 25–29 January 2010, and will discuss data input and the TRS draft.

## Meeting Summary

The status of the TRS, agreed with participants, was summarised by Diego Telleria as follows:

- the November meeting is confirmed and contact with the CSNC has commenced;
- the contributions of EMRAS II WG5 participants is likely to lead to substantial improvements in available data on CR for biota that can then be reported in the TRS;
- ICRP will use the database for deriving CR values for the RAP transfer report;
- the first draft text of the TRS will be prepared in November, it will be sent to the members of EMRAS II WG5 for comment at least 1 week before the EMRAS II TM takes place in January 2010. Discussion of the draft will be a major agenda item during the meeting;
- revisions and final peer review will occur during the first half of 2010 and the final draft should be ready by the end June 2010; and
- the online database will be maintained after the finalisation of the TRS to provide constant updating of CR values thereafter.

Brenda thanked all participants for their valuable contributions and willingness to contribute the discussions. She felt that the meeting had made significant progress in compiling and analyzing data which will be included in the production of the TRS.

### Action list (combines Vienna meeting and outstanding Monaco meeting items)

| Topic                       | Action   | Responsible organization                  | Action deadline   |
|-----------------------------|--|---|---|
| Online database             | Implement identified corrections   | EA  | Most by end Sept 09   |
| Freshwater ERICA database   | Provide information on which data were used and value of n for entries<br><br>Agree how we go forward. | STUK<br><br>Areva, CEH                    | 15 <sup>th</sup> August 2009<br><br>Within two weeks of above deadline                  |
| <i>Canada</i>               | <i>Input relevant data from various sources, including for sediment – assistance from industry</i>     | <i>CNSC</i>                               | <i>Some input by end summer 09, remaining one week before EMRAS II Jan 2010 meeting</i> |
|                             | Obtain formal agreement to input data already collated from COG  | AREVA                                     | By end August   |
|                             | Identify relevant data from other Canadian sources, reformat   | AREVA<br>CEH/EA to assist with formatting | For discussion in Nov meeting   |
| Russian language            | Improve and QC large Russian datasets for freshwater+marine, forest, tundra+meadows                    | RIARAE                                    | End October 09  |
| <i>Finland (and Baltic)</i> | <i>CR to fish for Cs and Sr for Baltic sea acquired from Germany</i>                                   | <i>STUK will add to estuaries DB</i>      | <i>(Aug/Sept)</i>   |
|                             | <i>New CR fw data for Po, Pb, Cs, Sr</i>   | <i>STUK to add</i>                        | <i>end Sept</i>   |
|                             | <i>Can also calculate extra CR from Helcom-Mors DB for biota in Baltic Sea</i>                         | <i>STUK</i>                               | <i>end Sep</i>  |
